INFO.: The present invention relates to antibodies, antibody conjugates, and compns. thereof, methods of antibody synthesis, and applications of antibodies useful for the in vivo-detection of nucleic acid mols. containing 2'-deoxy-2'-C-allyl Uridine, such as in a clin. setting. The antibodies of the invention are also useful as screening agents which allow the selection of candidate therapeutic mols. for optimum bioavailability and/or activity, and as agents for cell and tissue specific-delivery of nucleic acid mols. The example discloses the development of a monoclonal antibody, CAIUSR, and its use for detection of the ANGIOZYME® ribozyme therapeutic in vivo. This antibody was developed for use in monitoring clin. trials of ANGIOZYME.

     The present invention relates to nucleic acid mols., including
AB
     aptamers and antisense and enzymic nucleic acid mols., such as
     hammerhead ribozymes, DNAzymes, and antisense oligonucleotides,
     which modulate the expression of NOGO and NOGO receptor genes.
     particular, novel nucleic acid-based techniques are provided to
     inhibit the expression of NOGO-A, NOGO-B, and/or NOGO-C, NOGO-66
     receptor, and/or NI-250, myelin-associated glycoprotein, tenascin-R,
     and NG-2. The sequence of human NOGO and NOGO receptor genes are
     screened for accessible sites using a computer-folding algorithm;
     regions of the RNA that do not form secondary folding structures and
     contain potential enzymic nucleic acid mol and/or antisense
     binding/cleaving sites are identified. The nucleic acids of the
     present invention can be used to treat a patient having a condition
     associated with the level of NOGO or NOGO receptor.

ΑB This invention relates to enzymic nucleic acid mols. (e.g., ribozymes and DNAzymes) directed to cleave RNA species of hepatitis C virus (HCV) and/or encoded by the HCV. Specifically, the present invention describes enzymic nucleic acid mols. that would cleave in the conserved regions of the HCV genome. In a preferred embodiment, the invention features the use of an enzymic nucleic acid mol., preferably in the hammerhead, Inozyme (NCH), G-cleaver, Amberzyme, Zinzyme and/or DNAzyme motif, to inhibit the expression and/or replication of HCV. Chemical modifications in the sugar, base, and/or phosphate backbones of these enzymic nucleic acids is carried out to improve their stability. Such enzymic nucleic acid mols. may be used to treat diseases associated with HCV infection. Ribozymes in combination with interferons and polyethylene glycol interferons which have the potential to improve the effectiveness of treatment of HCV are also described. [This abstract record is one of two records for this document necessitated by the large number of index entries required to fully index the document and publication system constraints.].

AB The present invention relates to nucleic acid mols., including antisense and enzymic nucleic acid mols., such as hammerhead ribozymes, DNAzymes, allozymes and antisense, which modulate the expression of epidermal growth factor receptor genes. The sequence of human epidermal growth factor receptor (EGFR) gene is screened for accessible sites using a computer-folding algorithm. the RNA that do not form secondary folding structures and contain potential enzymic nucleic acid mol. and/or antisense binding/cleavage sites are identified and used to design the complementary regions of the antisense and enzymic nucleic acid Two human cell lines, A549 lung carcinoma cells and SKOV3 ovarian carcinoma cells known to express medium to high levels of EGFR protein, are used in anti-proliferation assays for nucleic acid screening. The invention designs, synthesizes and tests nucleic acid mols. that target both EGFR and HER2 RNA in cell proliferation and RNA reduction assays for potential use in treating cancer. abstract record is one of two records for this document necessitated by the large number of index entries required to fully index the document and publication system constraints.].

The present invention relates to nucleic acid mols., including
AB
     antisense and enzymic nucleic acid mols., such as hammerhead
     ribozymes, DNAzymes, allozymes and antisense, which modulate the
     expression of epidermal growth factor receptor genes.

     This invention features conjugates, compns., methods of synthesis,
     and applications thereof, including galactose, galactosamine,
     N-acetyl galactosamine, PEG, phospholipid, and human serum albumin
     (HSA) derived conjugates of nucleosides, nucleotides,
     non-nucleosides, and nucleic acids including enzymic nucleic acids,
     DNAzymes, allozymes, antisense, dsRNA, siRNA, triplex oligonucleotides, 2,5-A chimeras, decoys and aptamers.

for the detection and amplification of signaling agents using

enzymic nucleic acid constructs. These include hammerhead enzymic nucleic acid mols., inozymes, G-cleaver enzymic nucleic acid mols., zinzymes, amberzymes and DNAzymes. Kits for detection and amplification and uses of the invention in diagnostics, nucleic acid circuits, nucleic acid computers, therapeutics, target validation, target discovery, drug optimization, SNP detection, SNP scoring, proteome scoring and other uses are disclosed.

The cellular uptake, intracellular distribution, and stability of AB 33-mer deoxyribozyme oligonucleotides (DNAzymes) were examined in several cell lines. PAGE anal. revealed that there was a weak association between the DNAzyme and DOTAP or Superfect transfection reagents at charge ratios that were minimally toxic to cultured Cellular uptake was analyzed by cell fractionation of radiolabeled DNAzyme, by FACS, and by fluorescent microscopic anal. of FITC-labeled and TAMRA-labeled DNAzyme. Altering DNAzyme size and chemical did not significantly affect uptake into cells. Inspection of paraformaldehyde-fixed cells by fluorescence microscopy revealed that DNAzyme was distributed primarily in punctate structures surrounding the nucleus and that substantial delivery to the nucleus was not observed up to 24 h after initiation of transfection. Incubation in human serum or plasma demonstrated that a 3'-inversion modification greatly increased DNAzyme stability $(t1/2 \approx 22 \text{ h})$ in comparison to the unmodified form (t1/2The 3'-inversion-modified DNAzymes remained \approx 70 min). stable during cellular uptake, and catalytically active oligonucleotide could be extracted from the cells 24 h posttransfection. In smooth muscle cell proliferation assay, the modified DNAzyme targeting the c-myc gene showed a much stronger inhibitory effect than did the unmodified version. The present study demonstrates that DNAzymes with a 3'-inversion are readily delivered into cultured cells and are functionally stable for several hours in serum and within cells.

     The present invention relates to nucleic acid mols., including
AB
     enzymic nucleic acid mols., such as DNAzymes (e.g. DNA enzymes,
     catalytic DNA), siRNA, aptamers, and antisense that modulate the
     expression of Ras genes such as K-Ras, H-Ras, and/or N-Ras, HIV
     genes such as HIV-1, and HER2 (c-erbB2) gene. The sequence of human
     HER2 or Ras genes were screened for accessible sites using a
     computer-folding algorithm. Regions of the RNA that do not form
     secondary folding structure and contain potential enzymic nucleic
     acid mol. and/or antisense binding/cleavage sites are identified.
     The sequences of c-Ki-ras, c-Ha-ras, HER2, and HIV RNA
     binding/cleavage sites are provided, as are the sequences of
     designed enzymic nucleic acid mols., e.g., hammerhead ribozymes,
     DNAzymes, inozymes, zinzymes, and Amberzymes. [This abstract record
     is one of two records for this document necessitated by the large
     number of index entries required to fully index the document and
     publication system constraints.].

AΒ
     The present invention relates to nucleic acid mols., including
     antisense and enzymic nucleic acid mols., such as hammerhead ribozymes, DNAzymes, Inozymes, Zinzymes, Amberzymes, and G-cleaver
     ribozymes, which modulate the synthesis, expression and/or stability
     of a hepatitis C virus (HCV) or hepatitis B virus (HBV) RNA and
     methods for their use alone or in combination with other therapies.
     In addition, nucleic acid decoy mols. and aptamers that bind to HBV
     reverse transcriptase and/or HBV reverse transcriptase primer
     sequences and methods for their use alone or in combination with
     other therapies, are disclosed. Oligonucleotides that specifically
     bind the Enhancer I region of HBV DNA are further disclosed. The
     present invention further relates to the use of nucleic acids, such
     as decoy and aptamer mols. of the invention, to modulate the
```

expression of HBV genes and HBV viral replication. Furthermore, HBV animal models and methods of use are disclosed, including methods of screening for compds. and/or potential therapies directed against HBV. The present invention also relates to compds., including

enzymic nucleic acid mols., ribozymes, DNAzymes, nuclease-activating

compds. and chimeras such as 2',5'-adenylates, that modulate the expression and/or replication of HCV. [This abstract record is one of five records for this document necessitated by the large number of index entries required to fully index the document and publication system constraints.].

AB The present invention relates to nucleic acid mols., including antisense, enzymic nucleic acid mols., and RNA interference mols., which modulate the expression of genes encoding prostaglandin D2 receptor, adenosine receptor A1, NOGO receptor, IkB protein kinase, and protein kinase PKR. Thus, nucleic acids encoding these products are scanned to identify targets for cleavage by designed

Searcher: Shears 571-272-2528

enzymic nucleic acids, such as hammerhead ribozymes, Inozymes, Zinzymes, DNAzymes, and Amberzymes. Chemical modifications in the sugar, base, and/or phosphate backbones of these enzymic nucleic acids is carried out to improve their stability. Inhibition of gene product expression may be used for treatment of diseases associated with said expression. [This abstract record is one of four records for this document necessitated by the large number of index entries required to fully index the document and publication system constraints.].

AB The present invention relates to nucleic acid mols. (e.g., ribozymes, DNAzymes, antisense oligonucleotides, triplex-forming oligonucleotides, 2-5A oligonucleotides, decoys) that modulate the expression and/or replication of West Nile Virus (WNV). Such enzymic and antisense nucleic acids can be used to diagnose and treat diseases associated with WNV infection, such as pancreatitis, encephalitis, myocarditis, meningitis, neurol. infection, hepatitis, liver failure, hepatocellular carcinoma, and cirrhosis. Thus, the sequence of human WNV was screened for accessible sites using a computer-folding algorithm; regions of the RNA that do not form secondary folding structures and contain potential enzymic nucleic acid and/or antisense binding/cleavage sites were identified. Enzymic nucleic acids mols. are designed that could bind each target and are individually analyzed by computer folding. Varying binding arm lengths can be chosen to optimize activity. Five different enzymic nucleic acid mols. of different motifs (hammerhead, inozyme, DNAzyme, Amberzyme, and zinzyme) show cleavage data with full-length or partially full-length, internally-labeled target RNA. enzymic nucleic acid mols. are effective against WNV RNA in vivo (HeLa cells) and in animal models (mice infected with WNV). abstract record is one of nine records for this document necessitated by the large number of index entries required to fully index the document and publication system constraints.].

AB A novel and general approach is described for generating versions of RNA-cleaving ribozymes (RNA enzymes) and DNAzymes (DNA enzymes), whose catalytic activity can be controlled by the binding of activator mols. Variants of the RNA-cleaving 10-23 DNAzyme and 8-17 DNAzyme were created, whose catalysis was activated by up to .apprx.35-fold by the binding of the effector adenosine. The design of such variants was possible even though the tertiary folding of the two DNAzymes is not known. Variants of the hammerhead ribozyme were constructed, to respond to the effectors ATP and FMN. Whereas in conventional allosteric ribozymes, effector-binding modulates the chemical step of catalysis, here, effectors exercise their effect upon the substrate-binding step, by stabilizing the enzyme-substrate complex. Because such an approach for controlling the activity of DNAzymes/ribozymes requires no prior knowledge of the enzyme's

secondary or tertiary folding, this regulatory strategy should be generally applicable to any RNA-cleaving ribozyme or DNAzyme, natural or in vitro selected, provided substrate-recognition is achieved by Watson-Crick base-pairing.

Attempts using in vitro and in vivo selection procedures have been made to search for hammerhead ribozymes that have higher activities than the wild-type ribozyme and also to determine whether other sequences might be possible in the catalytic core of the hammerhead ribozyme. Active sequences selected in the past conformed broadly to the consensus core sequence except at A9, and no sequences were associated with higher activity than that of the hammerhead with the consensus core, an indication that the consensus sequence derived from viruses and virusoids is probably the optimal sequence. Recently, during construction of ribozyme expression vectors, we isolated a mutant hammerhead ribozyme, with an insertion of G between A9 and G10.1, that appeared to show significant activity. We, therefore, characterized kinetic properties of the G-inserted mutant ribozymes in terms of the NUX rule. We demonstrate that the NUX rule is basically applicable to the G-inserted ribozymes and, more importantly, one type of G-inserted ribozyme was very active with kcat value of 6.4 min-1 in 50 mM Tris-HCl (pH 8.0) and 10 mM MgCl2 at 37°C.

Selective inactivation of a target gene by antisense mechanisms is AB an important biol. tool to delineate specific functions of the gene product. Approaches mediated by ribozymes and RNA-cleaving DNA enzymes (DNA enzymes) are more attractive because of their ability to catalytically cleave the target RNA. DNA enzymes have recently gained a lot of importance because they are short DNA mols. with simple structures that are expected to be stable to the nucleases present inside a mammalian cell. The authors have designed a strategy to identify accessible cleavage sites in HIV-1 gag RNA from a pool of random DNA enzymes, and for isolation of DNA enzymes. A pool of random sequences (all 29 nucleotides long) that contained the earlier-identified 10-23 catalytic motif were tested for their ability to cleave the target RNA. When the pool of random DNA enzymes was targeted to cleave between any A and U nucleotides, DNA enzyme 1836 was identified. Although several DNA enzymes were identified using a pool of DNA enzymes that was completely randomized with respect to its substrate-binding properties, DNA enzyme-1810 was selected for further characterization. Both DNA enzymes showed target-specific cleavage activities in the presence of Mg2+ only. When introduced into a mammalian cell, they showed interference with HIV-1-specific gene expression. This strategy could be applied for the selection of desired target sites in any target RNA.

                                                              A1 20000328
                                           US 2000-536393
     A method for identifying sites on a target RNA which are accessible
AΒ
     to pairing by antisense DNA, ribozymes or DNAzymes. Native or in
     vitro -synthesized target RNA is incubated with defined ODNs and
     RNase H, or with a random or semi-random ODN library and RNase H, or
     with defined ribozymes or DNAzymes, or with a semi-random ribozyme
     or DNAzyme library, in a cell extract containing endogenous RNA binding
     proteins, or in a medium which mimics a cell extract due to presence of
     one or more RNA-binding proteins. Any antisense ODN, ribozyme or
     DNAzyme which is complementary to an accessible site in the target
     RNA hybridizes to that site and the RNA is cleaved at that site.
     Reverse transcription can be used to generate a first strand DNA
     from the RNA cleavage product, and terminal deoxynucleotidyl
     transferase-dependent polymerase chain reaction (TDPCR) can be used
     to identify sites on target RNA to which antisense ODNs, ribozymes
     or DNAzymes have bound and cleavage has occurred. The method was
     applied to identification of hammerhead ribozyme cleavage sites on
     human gene AIB1 mRNA as well as murine DNA methyltransferase mRNA.

     A crystal structure of a 108 nucleotide RNA-DNA complex containing a
     four-way junction was solved at 3.1 Å resolution The structure of
     the junction differs substantially from the "stacked-X" conformation
     observed previously, due to a 135° rotation of the branches.
     Comparison of the two conformers provides insight into the factors
     contributing to the flexibility of four-way junctions.
     stacked-X conformation maximizes base-stacking but causes
     unfavorable repulsion between phosphate groups, whereas the 135
```

°-rotated "crossed" conformation minimizes electrostatic clashes at the expense of reduced base-stacking. Despite the large rotation of the branches, both junction structures exhibit an antiparallel arrangement of the continuous strands and opposite polarity of the crossover strands. DNA enzyme bound to an RNA substrate was determined by x-ray diffraction at 3.0 Å resolution. The 82-nucleotide complex contains two strands of DNA and two strands of RNA that form five double-helical domains. The spatial arrangement of these helixes is maintained by two four-way junctions that exhibit extensive base-stacking interactions and sharp turns of the phosphodiester backbone stabilized by metal ions coordinated to nucleotides at these junctions. Although it is unlikely that the structure corresponds to the catalytically active

conformation of the enzyme, it represents a novel nucleic acid fold with implications for the Holliday junction structure.

```

The present invention discloses DNA enzymes -- catalytic or enzymic AB DNA mols. -- capable of cleaving nucleic acid sequences or mols., particularly RNA, in a site-specific manner, as well as compns. including same. The catalytic DNAs have first and substrate binding regions flanks a core region, wherein the first substrate binding region has a sequence complementary to a first portion of the preselected substrate nucleic acid sequence, and the second substrate binding region has a sequence complementary to a second portion of the preselected substrate nucleic acid sequence. The core region has a sequence according to the formula T(stem)'AGC(stem)"Z, where the (stem)' and (stem)" are each 3 sequential nucleotides which when hybridized as a (stem)':(stem)" pair comprise 3 base pairs including at least two G:C pairs and wherein Z = WCGR or WCGAA, and W = A or T and R = A or G. Also contemplated is a core region having a sequence RGGCTAGCXACAACGA, wherein X = T, C or A, and R = A or G. Methods of making and using the disclosed enzymes and compns. are also disclosed. An exemplary method of engineering enzymic DNA mols. that cleave phosphoester bonds comprises the following in vitro selection/evolution steps: (1) obtaining a population of single-stranded DNA mols.; (2) introducing genetic variation into the population to produce a variant population; (3) selecting individuals from the variant population that meet predetd. selection criteria; (4) separating the selected individuals from the remainder of the variant population; and (5) amplifying the selected individuals. Deoxyribozymes variants designated 8-17 (core region 5'cttccaccttccgagccggacgaagttacttttt-3') and 10-23 (core region 5'-ctttggttaggctagctacaacgatttttcc-3') have turnover nos. and kobs of 0.5 and 1 h-1, 0.002 and 0.01 min-1, resp., in 10 mM Mg2+, pH 7.5 and 37° .

DOCUMENT TYPE: Journal LANGUAGE: English

An in vitro selection procedure was used to develop a DNA enzyme that can be made to cleave almost any targeted RNA substrate under simulated physiol. conditions. The enzyme is comprised of a catalytic domain of 15 deoxynucleotides, flanked by two substrate-recognition domains of seven to eight deoxynucleotides each. The RNA substrate is bound through Watson-Crick base pairing and is cleaved at a particular phosphodiester located between an unpaired purine and a paired pyridine residue. Despite its small size, the DNA enzyme has a catalytic efficiency (Kcat/Km) of ≈109 M-1/min-1 under multiple turnover conditions, exceeding that of any other known nucleic acid enzyme. Its activity is dependent on the presence of Mg2+ ion. By changing the sequence of the substrate-recognition domains, the DNA enzyme can be made to target different RNA substrates. In this study, for example, it was directed to cleave synthetic RNAs corresponding to the start codon region of HIV-1 gag/pol, env, vpr, tat, and nef mRNAs.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  23
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Conservative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent B. coli XL10-Gold (Stratagene) cells and selected for ampicilin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            musculus C57BL/6J (male) was obtained from the Jackson
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /lab_host="E.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Conservative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligomucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pND42 (gil4732114]gblAF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and the restricted mass annealed to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

/note="Vector: Lambda ZAP II; Site 1: EcoR I; Site 2: Xho
I, PolyA+ RNA, from asynchronous blood stage parasites of
the Dd2 isolate cultured in vitro, was reverse transcribed
using an oilgo dT-Xho I primer. Second strand was
prepared using RNase H and DNA polymerase I. EcoR I
adapters were ligated to the cDNA, and it was digested
with Xho I. Prepared fragments were ligated into EcoR I +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                double-stranded cDNA was ligated to Hind III adaptors (Pharmacia), digested with Not I and directionally cloned into the Not I and Hind III sites of the Action Library went through one round of normalization.                                                                                 second-strand synthesis, the cDNA ends were 'polished' with clone Pfu DNA polymerase, ligated to EcoRI adapters, and phosphorylated. The XhoI site within the first-strand synthesis primer was restricted by digestion with XhoI, all XhoI sites in the cDNA would be protected by their hemimethylated status. The cDNA constructs were size-fractionated with a 500bp cutoff, using GibcoBRL Life Technologies' cDNA Size Fractionation column. The column eluent was then ligated into Stratagene's pBluescript II XR Predigested vector (pBluescript II SK(+) that had been discorded with a 500 by constructs with Toward beautiful to the column of the column 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /clone libe "Gm.-c1004"

                                                                                                      // Notes "Vector: pBluescript II SK-; Site 1: EcoRI; Site 2: XhoI; Deflagellation library, constructed by John Davies and Jeffrey McDermott, combines cDNAs from CC-1690 cells which had been re-synthesizing flagella for 15, 30 and 60 min after being deflagellated by pH shock. PolyA mRNA was purified from each sample, pooled and cDNA synthesized. The cDNA was directionally cloned into lambda Zap II (Stratagene) in the EcoRI (5') and XhoRI (3') sites. pBluescript II SK- plasmids were excised from the lambda ZAP clones by superinfection with ExAssist (Stratagene) phage. The library was normalized using method 4 described in Bonaldo et al., (1996) Genome Research 6: 791-806."

/note="PCR was performed on DNA from Arabidopsis thaliana
plants (T1) which were transformed with the T-DNA from
vector pAC161. The lines contain one or more T-DNA
insertions. The DNA fragment(s) resulting from the PCR
were directly sequenced to determine the genomic sequence
flanking the insertion. Sequences displaying significant
similarity to the A. thalaina nuclear genome sequence were
processed for submission. T-DNA derived sequences were
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 organism="Arabidopsis thaliana"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWH2 (gi[4732114]gb]AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coll XIIO-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         .ass: plasmid ends
                                                                                                                                                                                                                                                                                                                            sapiens (human)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with 74 DNA polymerase and 74 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agazose gel electrophoresis. Vector DNA was prepared from a derivative of pwh92 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Conservative

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /note=Torgan: lung; Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; Plasmid DNA from the normalized modified polylinker; Plasmid DNA from the normalized library NCI CGAP Lu5 was prepared, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from a pool of 5,000 clones made from the same library (cloneIDs cloneIDs and 1520904-152349). Subtraction by Bento Soares and M. Fatima Bonaldo.

Genomic inserts of 3 to candida tropicalis and Yarrowia lipolytica. Genomic inserts of 3 to candida tropicalis and yarrowia lipolytica. Genomic inserts of 5 kb were prepared and both extremities were sequenced. See keywords for description of this sequence and for the sequence of Location/Qualifiers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Souciet, J.L., Aigle, M., Artiguenave, F., Francisco, Souciet, J.L., Aigle, M., Artiguenave, F., Lasaregola, S., Bolotin-Fukuhara, M., Bon, B., Brottier, P., Lepingle, A., Llorente, B., de-montigny, J., Dujon, B., Durrens, P., Lepingle, A., Llorente, S., de-montigny, J., Dujon, B., Durrens, P., Lepingle, A., Peureglise, C., Ozier-Kalogeropoulos, O., Potier, S., Mandalpertuy, A., Neuveglise, C., Ozier-Kalogeropoulos, O., Potier, M., Mesolowski-Louvel, M., Malpertuy, A., Neuveglise, C., Wesolowski-Louvel, M.,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     de Montigny, J., Straub, M., Potier, S., Tekaia, F., Dujon, B., Wincker, P., Artiguenave, F. and Souciet, J. Genomic exploration of the hemiascomycetous yeasts: 8. Zygosaccharomyces rouxii
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Genomic exploration of the hemiascomycetous yeasts: 1. A set of yeast species for molecular evolution studies FEBS Lett. 487 (1), 3-12 (2000)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Saurin, W., Tekaia, F., Toffano-Nioche, C., Wesolowski-Louvel, M., Wincker, P. and Weissenbach, J.

RescueMu is a 4.9 kb, modified maize from total genomic DNA
designed to allow plasmid rescue from total genomic DNA
whits. For more information on RescueMu, 90 to the web
units. For more information on RescueMu, 90 to the web
site 'www.zmbb.iastate.edu' and follow the links for
'RescueMu.' Grid H was grown at Berkeley in 2001. DNA
'RescueMu.' Grid H was grown at Berkeley in 2001. DNA
was extracted from leaf punches, double digested using
was extracted from leaf punches, double digested using
banHI and BglII, and ligated to form circular plasmids.
DH10B cells were transformed and then screened on LB
plates with ampicillin."
